Step-by-Step Service Procedure

Preparation and Inspection

Begin with a thorough visual inspection: Check the overall condition of the jack's frame and saddle for cracks or deformation. Examine hydraulic hoses and connections for leaks, cracks, or wear. Inspect the hydraulic fluid level via the sight window or dipstick. Note any visible signs of corrosion or contamination.

Tools Needed: Wrench set, Screwdrivers, Clean cloths, Drain pan.

Replacement parts (seals, hoses, hydraulic fluid)

Depressurize and Drain Hydraulic Fluid

Safety first: ensure the jack is fully lowered and no load is present. Engage the release valve slowly to vent any built-up pressure. Place a drain pan beneath the hydraulic reservoir. Remove the reservoir cap or drain plug to drain old hydraulic fluid. Collect and dispose of the fluid per environmental regulations.

Disassemble for Internal Inspection

Remove the pump assembly and hydraulic cylinder if needed. Carefully disassemble the pump handle and cylinder components. Inspect internal parts for corrosion, scoring, or damage. Check the condition of seals, O-rings, and gaskets. Note: Keep track of all parts and their orientation for reassembly.

Clean and Replace Worn Components

Clean all components with a solvent compatible with hydraulic fluids. Replace any damaged seals, O-rings, or worn-out hoses. Inspect the piston and cylinder bore for scoring; replace if necessary. Ensure the pump's check valves and relief valves function correctly.

Tip: Use original Lincoln replacement parts to maintain compatibility and safety.

Reassemble and Fill with Hydraulic Fluid

Reassemble the pump and cylinder, ensuring all seals are seated properly. Reinstall the reservoir and fill with the recommended hydraulic fluid type and quantity (refer to the user manual for specifications). By hand, operate the pump handle several times to circulate the fluid and remove air pockets.

Bleeding the Hydraulic System

Air in the hydraulic lines can cause inconsistent operation: With the jack on a stable surface, engage the pump handle to lift a test load. Slowly open the release valve slightly to release trapped air. Repeat the process until the jack lifts smoothly and holds pressure without sponginess. Check for leaks during this process.

Final Inspection and Testing

Confirm all components are correctly assembled and tightened. Lower and raise the jack multiple times to verify consistent operation. Observe for leaks or abnormal noises. Ensure the release valve functions smoothly, allowing controlled lowering.

Troubleshooting Common Issues

Problem: Jack doesn't lift or has

reduced lifting capacity. Possible causes: Insufficient hydraulic fluid. Air trapped in the system. Worn or damaged seals. Piston or cylinder scoring. Solutions: Refill or replace hydraulic fluid. Bleed the system to remove air. Replace damaged seals or worn parts. Inspect and repair internal components as needed.

Problem: Hydraulic fluid leaks during operation. Possible causes: Damaged seals or O-rings. Loose fittings or connections. Cracked or worn hoses. Solutions: Replace faulty seals or O-rings. Tighten fittings and connections. Replace damaged hoses.

Problem: Slow or unresponsive lifting. Possible causes: Contaminated hydraulic fluid. Air in the system. Worn pump components. Solutions: Replace contaminated fluid. Bleed the system. Overhaul or replace pump components.
