Approach: Use steam tables to find enthalpy and entropy values at each state. Calculate work done by turbine and pump. Determine heat supplied and rejected. Compute efficiency as (Net work output / Heat input). This question requires familiarity with thermodynamic property tables and cycle analysis.

Mechanics of Materials: Bending Stress Calculation Question: A simply supported beam of length 4 meters carries a central load of 10 kN. The beam's cross-section is rectangular, 100 mm wide and 200 mm deep. Calculate the maximum bending stress. Approach: Calculate the moment at the center: $(M = \frac{P \times L}{4})$. Find section modulus $(Z = \frac{b \times d^2}{6})$. Compute bending stress $(\sigma = \frac{M}{Z})$. This problem emphasizes understanding of bending theory and section properties.

Fluid Mechanics: Pipe Flow Head Loss Question: Water flows through a horizontal pipe of diameter 0.2 m at a velocity of 2 m/s. Determine the head loss over a 50-meter length, given the Darcy friction factor is 0.02. Approach: Use Darcy-Weisbach equation: $(h_f = \frac{f L v^2}{2 g d})$. Substitute known values to find head loss. This calculation demonstrates the application of fluid flow principles and friction factor considerations.
